Syphoning the Life Out of Mexico: Stopping the Cycle of Tapeworms

Methods
• Partnership with GALVmed in order to get funding
• Grants from the Gates Foundation
• Partnership with the largest pork producer in Mexico, Granjas Carroll de México (GCM)

Oxfendazole is a cheap treatment to eradicate *T. solium* from the pigs
• Costs only 2 cents for a single dose (30 mg/kg)
• Pigs treated at 3 months old so protected until it is slaughtered at the six month mark

Results
Based on previous trials of oxfendazole, our treatment will result in a significant decrease in incidence of *T. solium* in GCM farms. Our success will allow expansion of the program to other GCM factories and eventually the entirety of Mexico’s pork industry.

Conclusions/Recommendations
• Stopped the cycle of tapeworms
• Decreased incidence of Cysticercosis in humans
• Improved Mexican Pork Industry

Syphoning the Life Out of Mexico: Stopping the Cycle of Tapeworms

Abstract
Tapeworms affect 12% of people in Mexico City. We intend to treat Mexico’s largest pork producer with oxfendazole. Success will be determined by a statistically significant decrease in infection of pigs by *T. solium*. Given our successful approach, treatment will spread to other GCM factories and eventually the entirety of Mexico’s pork industry.

Background
Cysticercosis, a serious disease capable of affecting the brain and muscles, is caused by a dangerous species of tapeworm, *Taenia solium*. Given our successful approach, treatment will spread to other GCM factories and eventually the entirety of Mexico’s pork industry.

Cysticercosis
1 in 10 people hospitalized for neurocysticercosis in the United States die.

Cysticercosis
Humans become infected with the *T. solium* eggs

Porcine Cysticercosis:
Pigs eat food infected with *T. solium*

Human Cysticercosis:
Humans become infected with the *T. solium* eggs

Tapeworms:
People eat poorly cooked, infected pork

Background
Cysticercosis, a serious disease capable of affecting the brain and muscles, is caused by a dangerous species of tapeworm, *Taenia solium*. Given our successful approach, treatment will spread to other GCM factories and eventually the entirety of Mexico’s pork industry.

• Spread through consumption of improperly cooked, infected pork
• Mainly prevalent in Latin America, but has spread to New York, California & Florida
• Identified as 1 of 6 preventable diseases through use of oxfendazole on pigs

Spread of Tapeworms

Native
Imported

Results
Based on previous trials of oxfendazole, our treatment will result in a significant decrease in incidence of *T. solium* in GCM farms. Our success will allow expansion of the program to other GCM factories and then entire Mexican pork industry, reducing new cases of *T. solium*.

Conclusions/Recommendations
• Stopped the cycle of tapeworms
• Decreased incidence of Cysticercosis in humans
• Improved Mexican Pork Industry
